I am born in a forest. A vision of a CO2-neutral village in the woods.

As a rule, forests are cut down when new areas are designated for housing, which leads to urban sprawl and environmental degradation: The habitat of animals is restricted, biotopes are destroyed and forests, that are important for the climate, are lost. Typically, building means: man against animal! We want to change that and propose a rethink of the relationship between humans and animals. Our project concerns solidarity with animals in human spaces and proposes a new way of cohabitation: Animals and plants get the ground floor

Wow! It's been ages since i last went shopping... Since i moved in this treehouse, I just havn't got enough space to store tons of clothings. Actually this a good thing! Now i only buy what i really need! This is good for my wallet, my CO2-footprint and somehow makes be free...

Today i'm going to have a warming party in my new tree house! You are all invited! It's so nice here because we are a big family and everybody is so nice to me! I feels like being in a community of dropouts!

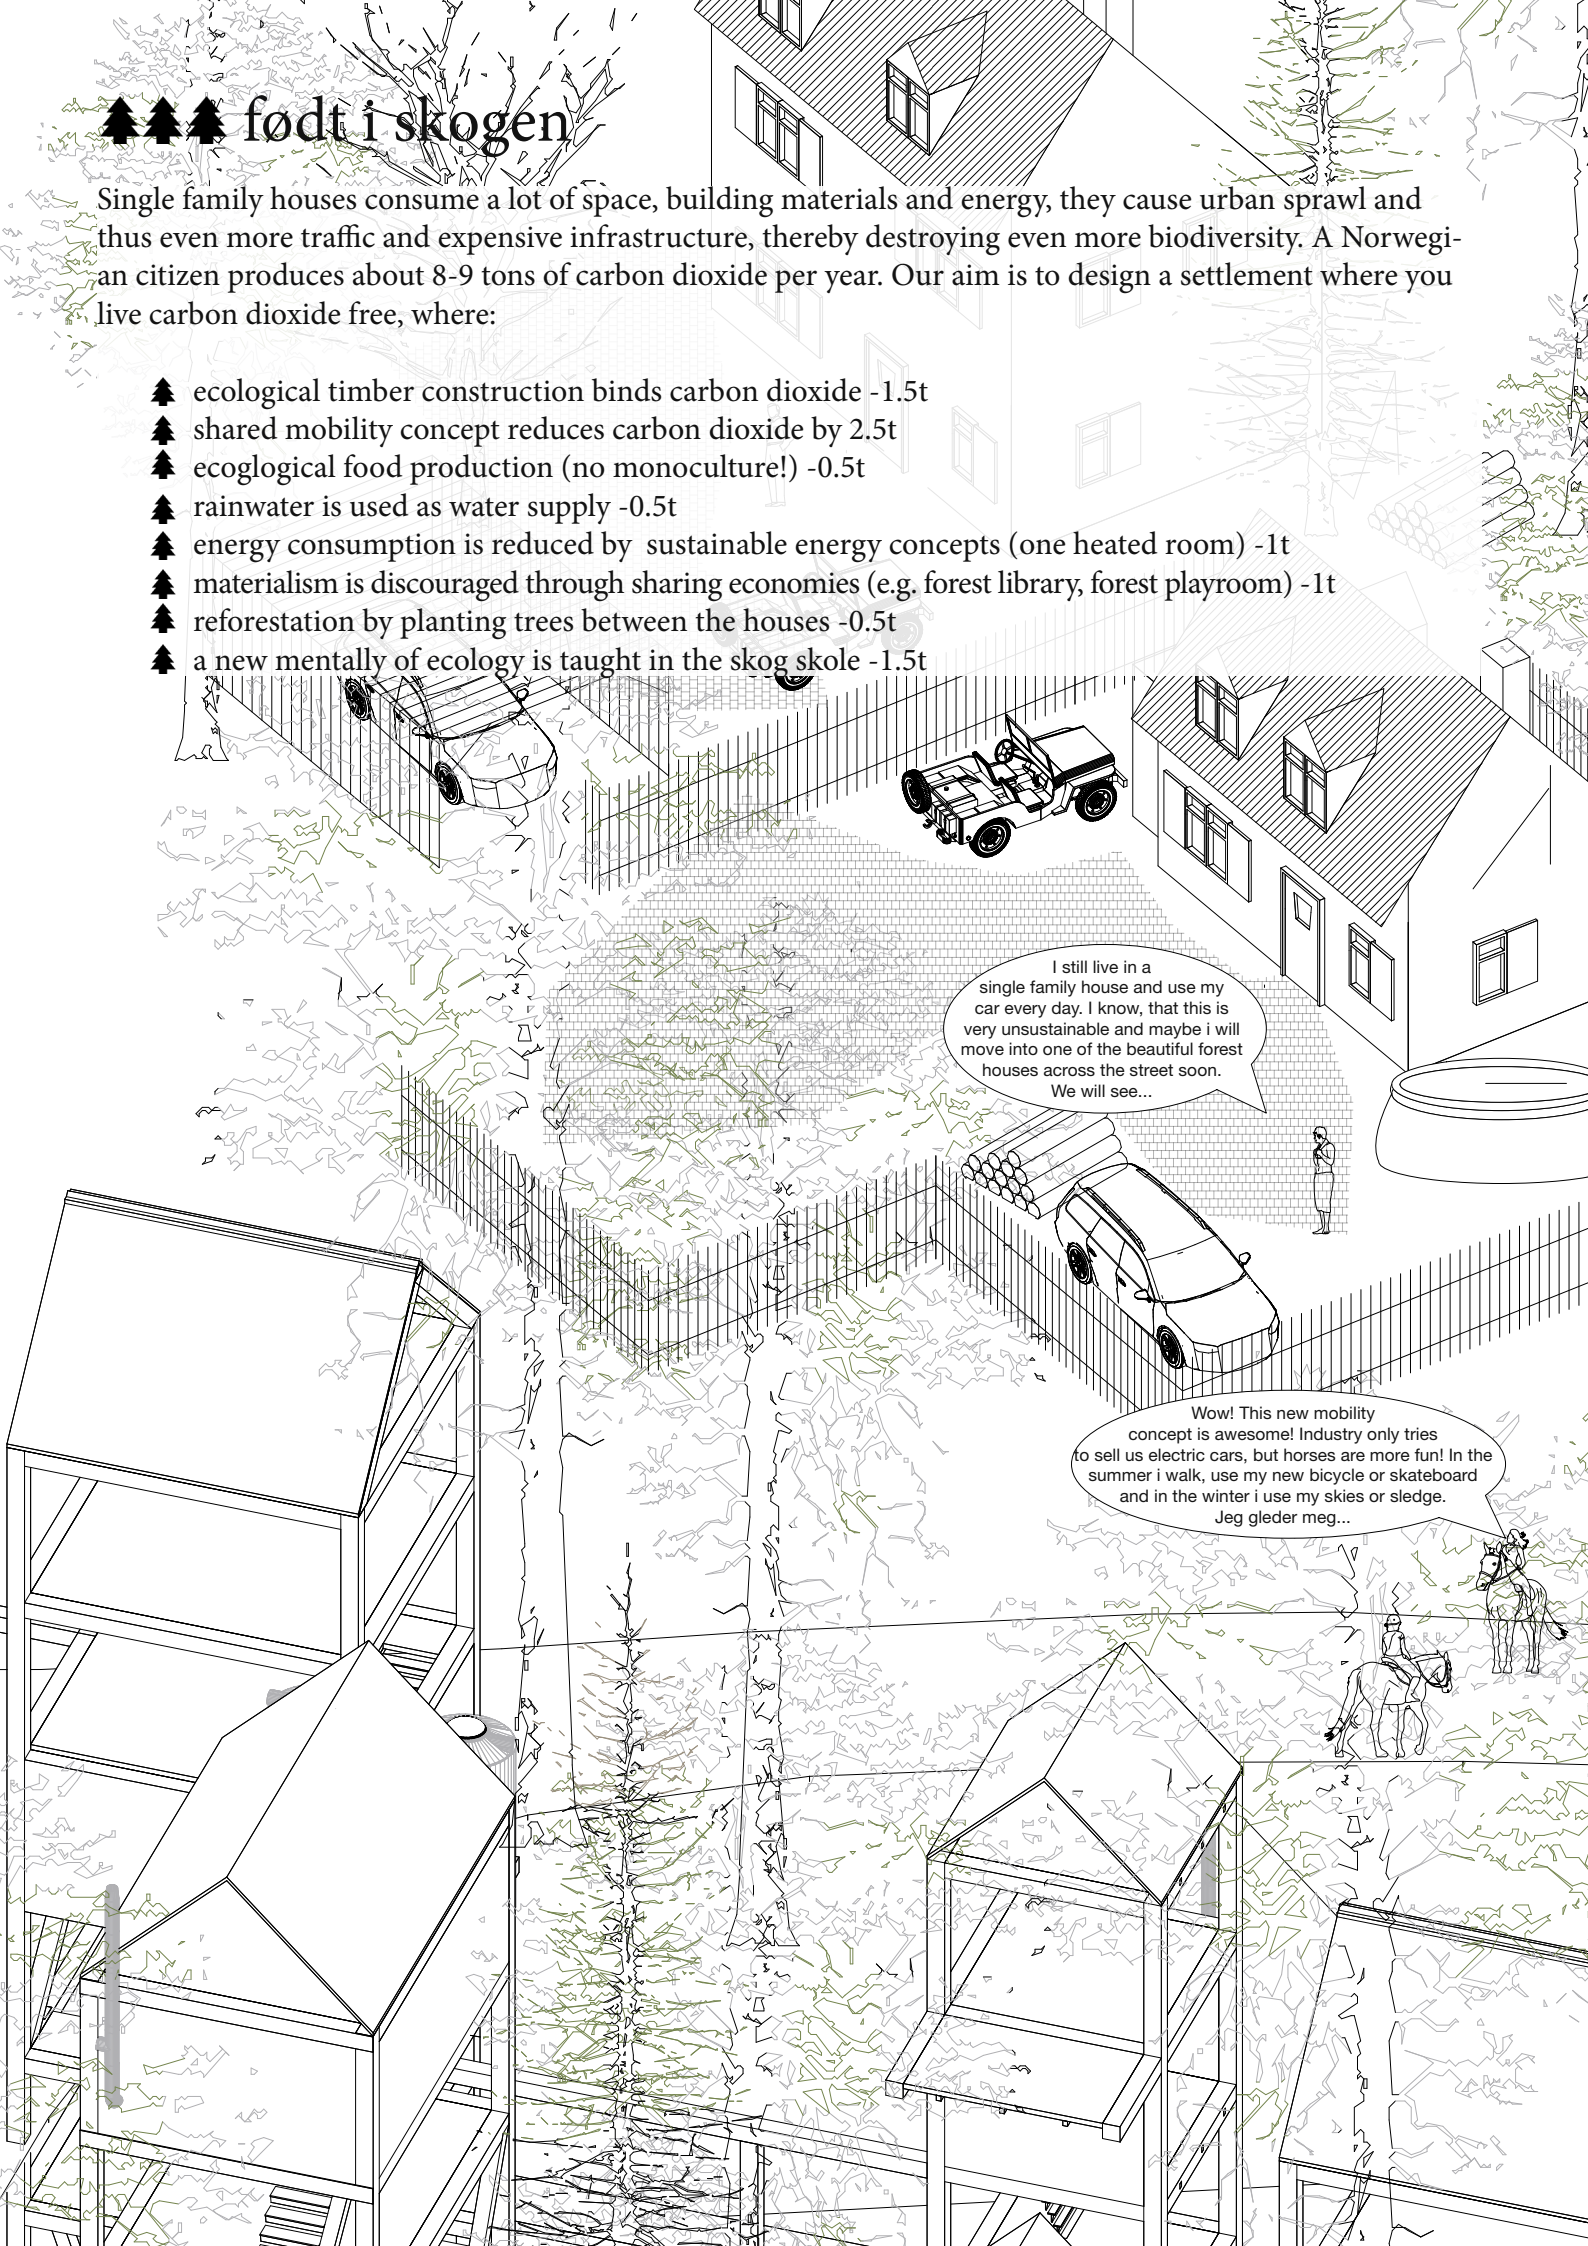

Shit! I am blind... Hvordan sitter jeg med skjegget i postkassa

Miss Lene Marlin, now i can show you the balcony. every house a balcony that is arranged in such way, that it cannot be seen from the others. Here you can sunbath topless. If you want to move in, you have to accept right away because i have a lot of interested parties. The apartment is very cheap.

Single family houses consume a lot of space, building materials and energy, they cause urban sprawl and thus even more traffic and expensive infrastructure, thereby destroying even more biodiversity. A Norwegian citizen produces about 8-9 tons of carbon dioxide per year. Our aim is to design a settlement where you live carbon dioxide free, where:

- 🌲 ecological timber construction binds carbon dioxide -1.5t
- 🌲 shared mobility concept reduces carbon dioxide by 2.5t
- 🌲 ecological food production (no monoculture!) -0.5t
- 🌲 rainwater is used as water supply -0.5t
- 🌲 energy consumption is reduced by sustainable energy concepts (one heated room) -1t
- 🌲 materialism is discouraged through sharing economies (e.g. forest library, forest playroom) -1t
- 🌲 reforestation by planting trees between the houses -0.5t
- 🌲 a new mentality of ecology is taught in the skog skole -1.5t

I love to live in nature!
I love to look out of the window!

Of course, living in the city in multi-story buildings can be a sustainable solution, but the dream of living in nature, the dream of your own four walls, the dream of independence and the dream of adventure is very present in Norwegian culture. The desire of living in a detached house is part of the Norwegian dream, and more than 60% of the Norwegians live in one. The problem: These detached houses don't deliver their inhabitants' desires.

- ☎ instead of living „in nature“, you live next to other ugly detached houses with coiffured gardens that have nothing to do with real nature.
- ☎ instead of neighborly exchange and community, you get annoyed about the lawnmower on Saturday mornings.
- ☎ instead of a happy family life, you split up and suddenly sit alone in a house that is far too big and far too expensive.
- ☎ instead of isolated living, the house forms a community with a high grade of identification

So we asked ourselves, how can we combine the dream of living in nature in your own house, on the one hand, and sustainability and community on the other. The question is, how does the single-family home really become what we are seeking? And here is the answer...

This is an amazing bathroom! You can lie in your bathtub, drink a glass of prosecco and look into the forest. A nice side effect: This bathroom is super sustainable! The water is collected at the roof and stored in big watertanks. Solar panels heat the water.

This architect must be tough. He forget to draw the fall protection. If something happens he will end up in jail! Should we jump, Arne? Or should we get drunk and challenge our fate?

Are you as... as me? I bet not! raining every day... than 4 hours... this foest run.

This is an amazing bathroom! You can lie in your bathtub, drink a glas of prosecco and look into the forest. A nice side effect: This bathroom is super sustainable! The water is collected at the roof and stored in big watertanks. Solar panels heat the water.

🌲🏠 instead of clearing forests and destroying nature, the new housing typology will produce a new natural environment. New trees are planted to help protect the climate. Of course, renaturation of forests is not the biggest issue in Norway, but the new settlement should be a prototype and inspire communities in other countries!

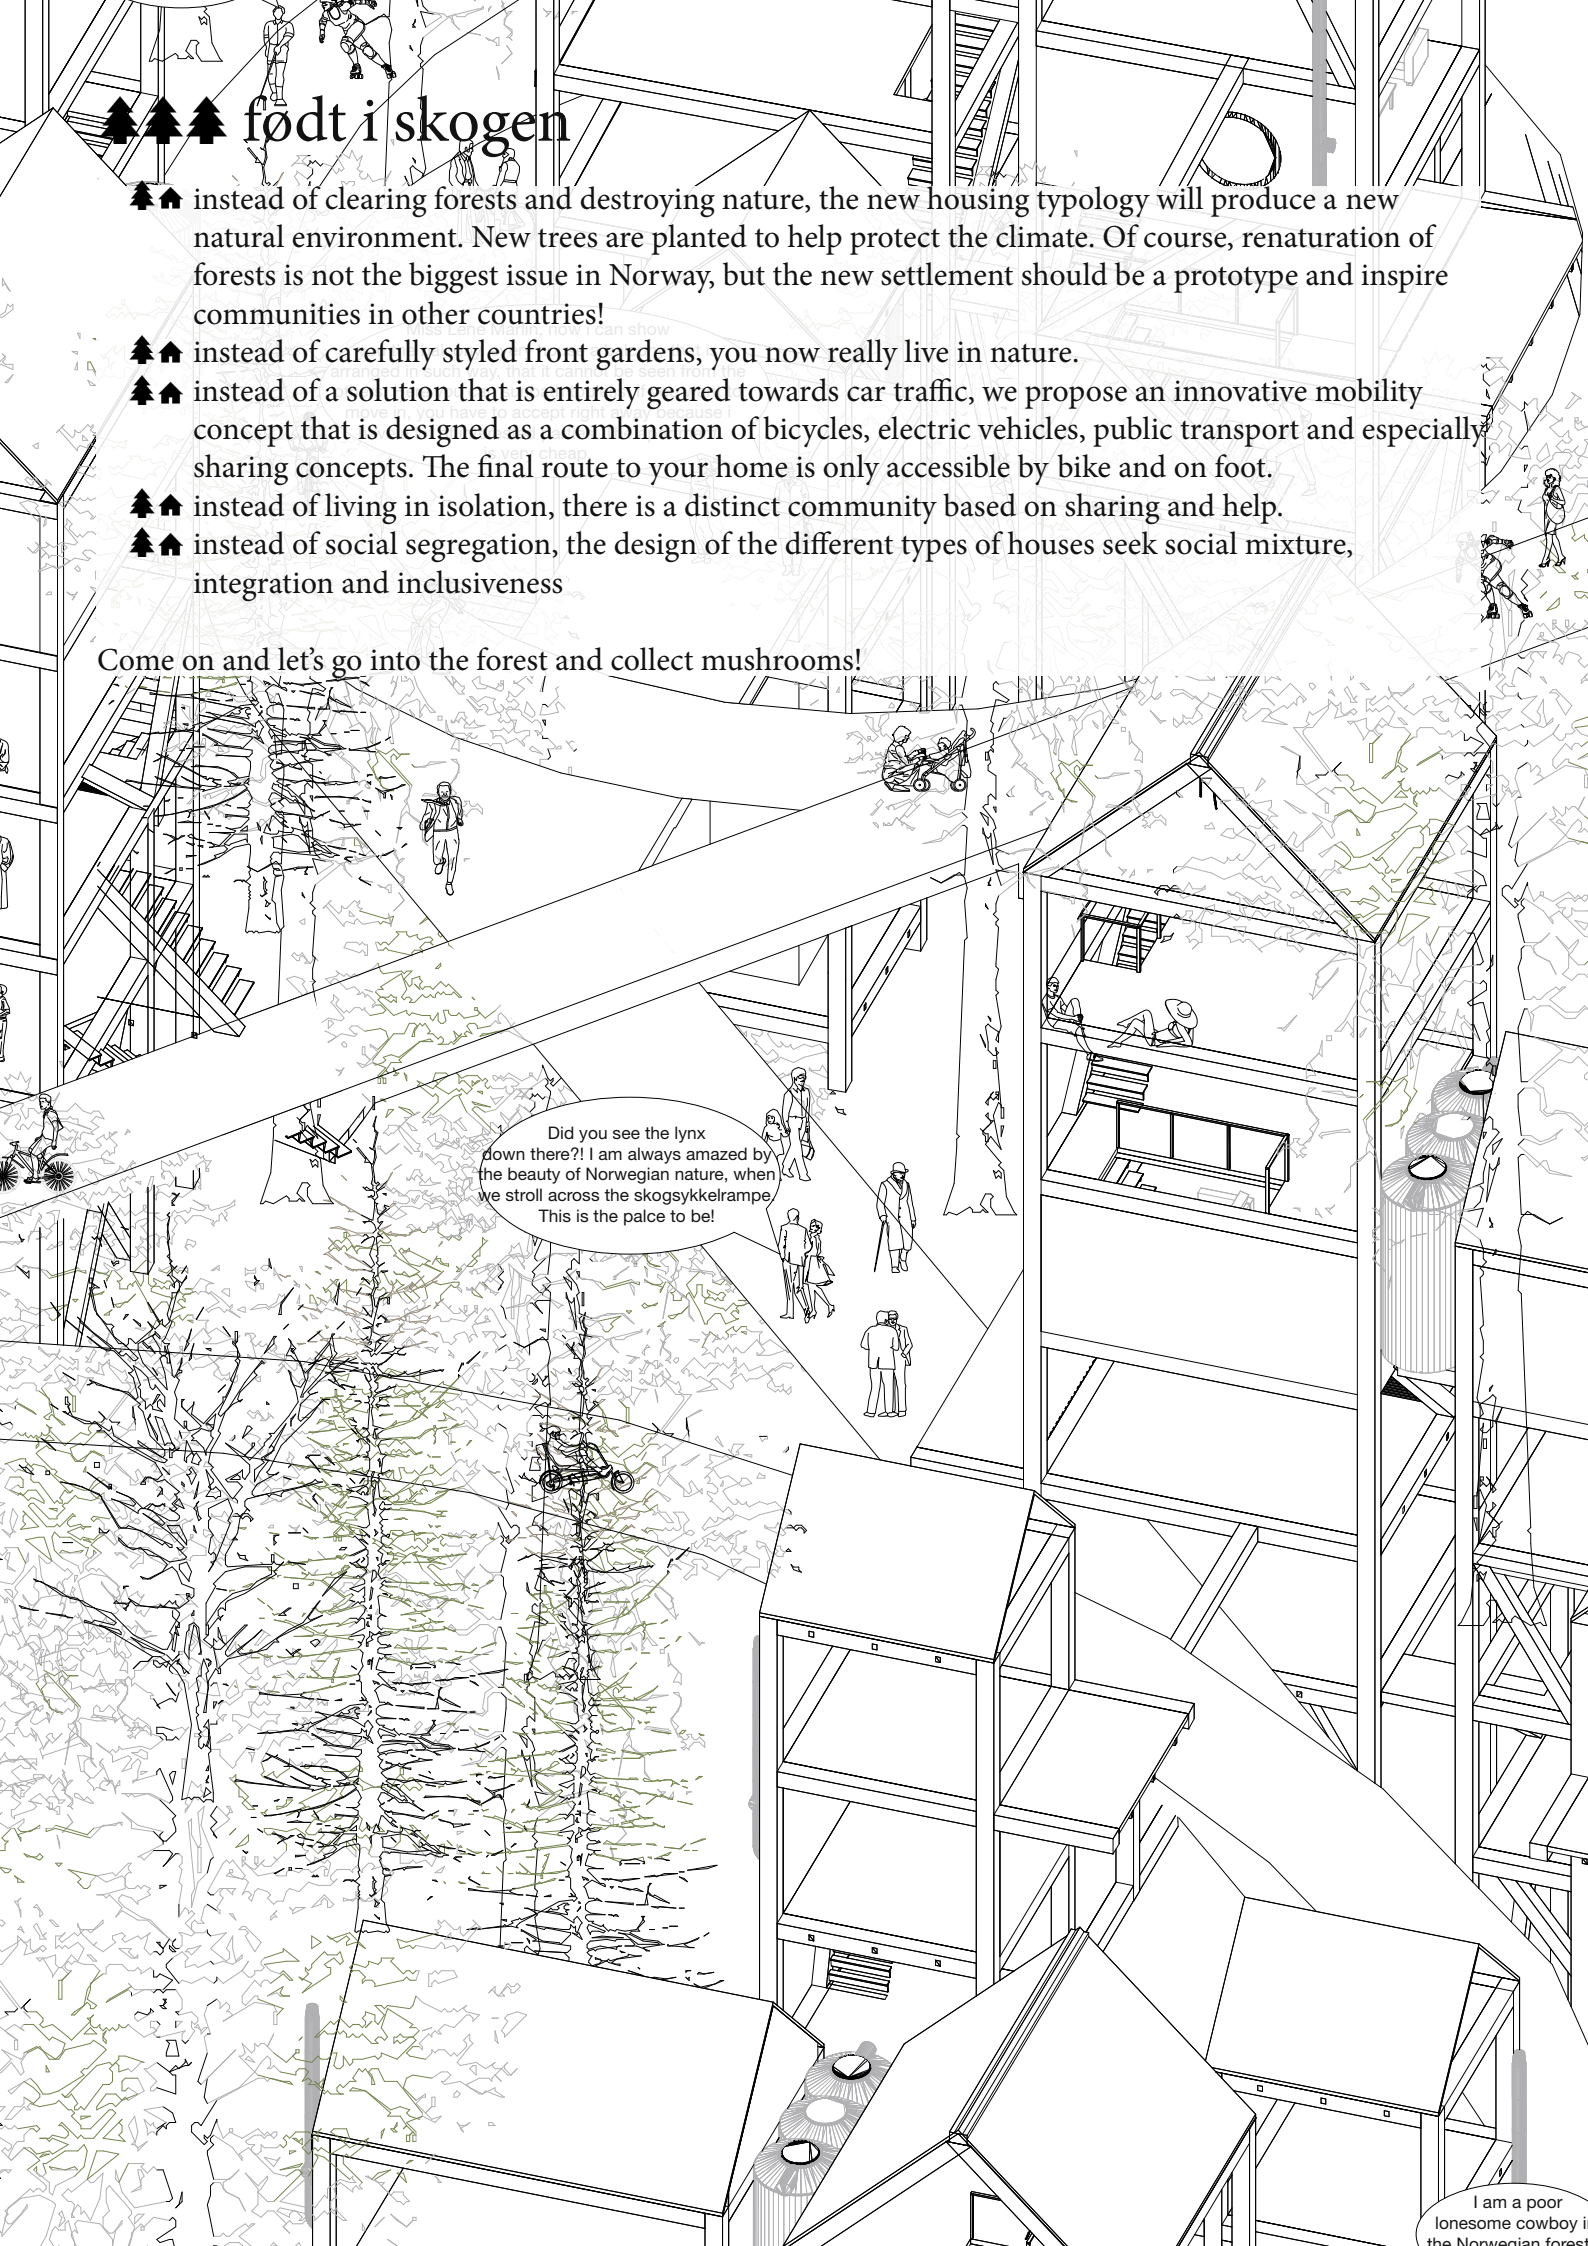

🌲🏠 instead of carefully styled front gardens, you now really live in nature.

🌲🏠 instead of a solution that is entirely geared towards car traffic, we propose an innovative mobility concept that is designed as a combination of bicycles, electric vehicles, public transport and especially sharing concepts. The final route to your home is only accessible by bike and on foot.

🌲🏠 instead of living in isolation, there is a distinct community based on sharing and help.

🌲🏠 instead of social segregation, the design of the different types of houses seek social mixture, integration and inclusiveness

Come on and let's go into the forest and collect mushrooms!

Did you see the lynx down there?! I am always amazed by the beauty of Norwegian nature, when we stroll across the skogsykelrampe. This is the palce to be!

I am a poor lonesome cowboy in the Norwegian forest
