

co-krøgenes 01

community is care

community is care. Since the beginning of time, people have come together, lived together, and taken care of themselves and their community. This is how our cities and societies came into being. In today's fast-paced world, these community ties are often diminishing and people are becoming more and more lonely, despite growing cities. Self care is good, but a sign that the larger context is not taking care of you enough.

The concept of co-krøgenes sees the solution in an approach that focuses on the community, the immediate lived environment and all those involved in it. Community is care! In contrast to the classic profit-oriented or simply housing-focused approach, the concept of co-krøgenes stands for a holistic approach. A caring community focuses on the needs of the residents, the environment and the future. A community is a space where people live, love and work. Through the encounters in the community, connections can be made and people get to know each other and understand their needs and can thus take care of them. A mindfulness for the lived environment is created.

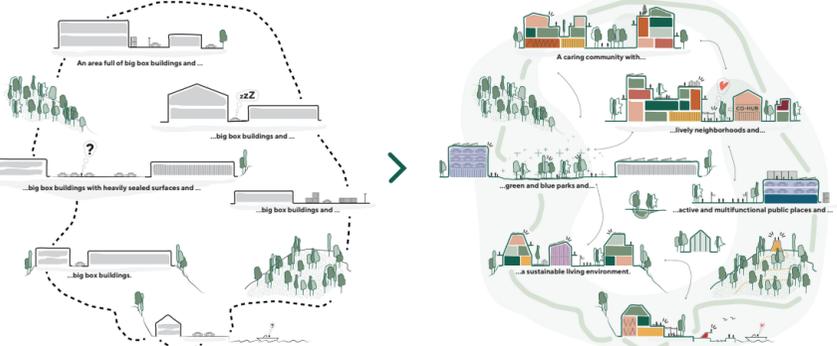

The concept creates a city in Krøgenes that promotes social interaction. The new part of the city offers diverse spaces for living, working, health, education, activities, nature, culture and much more. Co-krøgenes lives from its public spaces. These are the engine of the community. People meet here and synergies can arise. Cultural or generational barriers can be broken down by understanding the needs of other people.

From the small encounter in everyday life, with a nice greeting among neighbors, to close social contacts, Co-krøgenes offers space for all kinds of community and promotes the feeling of togetherness. The community itself benefits from these encounters and the resulting synergies. The residents individually utilize the spaces, form networks and have an interest in actively shaping the environment. In this way, the residents not only take care of the community, but also of the community itself.

The concept of co-krøgenes is not a finished design, but rather a first impulse for the development of a caring community in Krøgenes, which can always be adapted to current needs. Thus, this concept establishes the first spatial guidelines, sets out what resources planners have to design these spaces, and suggests how the process can be shaped.

From a gray monofunctional commercial area...

...to a lively and colorful community!

It is not possible to plan a caring community, but the spaces and opportunities can be offered that a caring community can emerge. This requires certain spatial as well as processual guidelines, which are the foundation for the development from today's Krøgenes to a caring community. The concept of co-krøgenes is based on three levels.

learning framework. This provides the overall spatial structures and adapts to developments and needs. **resources.** These show what tools planners have to create caring places and communities. These are subdivided into the four main themes of space, life, ecology and mobility and can be adapted to different developments. This is not a final plan, but rather an overview of measures that must be individually examined, selected and scaled for each location.

living lab. The Living Lab functions as a sustainable and flexible process that investigates, tests, adapts, implements and optimizes the developments within Krøgenes.

The transformation of Krøgenes is not about a quick implementation but a careful and gentle development. The local companies and structures also play an important role in this. Although Krøgenes in its current state is 'only' a shopping and industrial park with space-intensive uses without great public amenities or quality of life, it nevertheless performs a number of important functions in the city of Arendal and the region. In addition to utilities such as supermarkets and social facilities such as a medical center and a gym, Krøgenes is home to a large number of workplaces. In the transformation of the area it will be important to include these existing structures, which are worth preserving, in the planning and to combine them with the new uses.

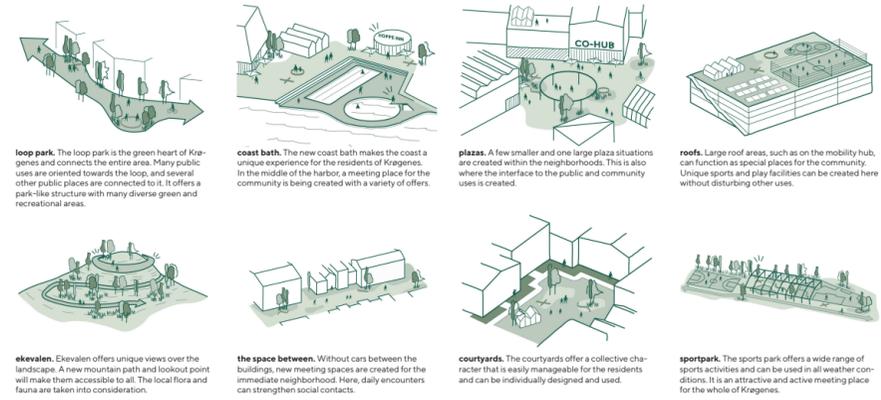

co-krøgenes 02

the path to a caring community

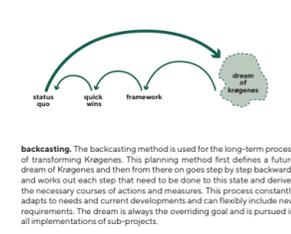

The dream of co-krøgenes is a possible scenario of the ideal state for the future area of Krøgenes. This is of course not a finished state or design, but rather an impulse to stimulate and imagine what Krøgenes could be one day. The overall goal is to create an optimal structure and conditions for a caring community that has established itself in the course of the transformation process at this location. Thus, the former gray monofunctional shopping and industrial park has become a lively and colorful public center in Arendal. Diverse and mixed spaces invite residents and users to linger and communicate. The newly created neighborhoods are subdivided into versatile residential typologies and thus makes it possible for all people with different income structures and lifestyles to find a place here. At the same time, the three different neighborhoods stand out from one another and have developed an identity adapted to the location. These neighborhoods are connected by the high-quality and formalized public space. This coherent element is subdivided into several small public spaces and offers the users a variety of possibilities to appropriate them. In addition to small recreational and meeting spaces distributed throughout the area, the focus is particularly on the defining places for the community. Lively places have been created here that make Krøgenes an attractive place to live. Krøgenes lives from these public spaces that people like to use and spend time in. Here people come into contact and get to know each other and their needs. Interpersonal contacts are made and people care about each other and the community. In addition, the public space offers particularly versatile possibilities to use it actively. Sports and playgrounds as well as natural recreational areas provide a healthy way to move. Due to the newly created green spaces and the climatic adjustments, a pleasant microclimate prevails, which promotes to stay in the public spaces. The rainwater that accumulates can be retained on site, stored and used later. In the process, the former parking lot acts as a natural retention area. The artificial channels could be eliminated and the area unsealed. The focus is on a walkable approach by adapting the mobility system and the traffic routing, as well as any offers of use in the immediate vicinity. Cars can be parked in the three mobility hubs and enable a car-free public space that ensures that a safe crossing for any age or user group is possible. The dream of the city has been developed in Krøgenes, where a community has grown naturally. This community has already taken care of Krøgenes during its development and will continue to do so in the future.

places for the community

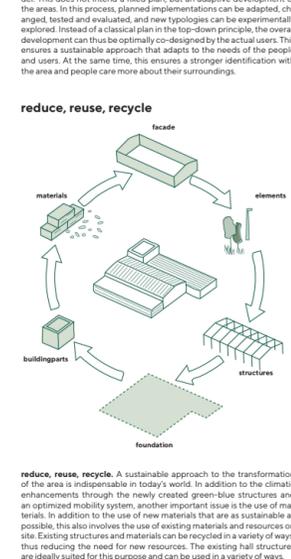

co-krøgenes as a living-lab

backcasting. The backcasting method is used for the long-term process of transforming Krøgenes. This planning method first defines a future dream of Krøgenes and then from there on goes step by step backwards and works out each step that needs to be done to reach this state and derives the necessary courses of actions and measures. This process constantly adapts to needs and current developments and can flexibly include new requirements. The dream is always the overriding goal and is pursued in all implementations of sub-projects.

living lab. The transformation of Krøgenes is based on the living lab model. This does not intend a fixed plan, but an adaptive development of the area. In this process, planned implementations can be adapted, changed, tested and evaluated, and new typologies can be experimentally explored. Instead of a classical plan in the top-down principle, the overall development can thus be optimally co-designed by the actual users. This ensures a sustainable approach that adapts to the needs of the people and users. At the same time, this ensures a stronger identification with the area and people care more about their surroundings.

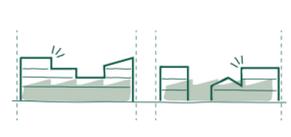

reduce, reuse, recycle

reduce, reuse, recycle. A sustainable approach to the transformation of the area is indispensable in today's world. In addition to the climatic enhancements through the newly created green-blue structures and an optimized mobility system, another important issue is the use of materials. In addition to the use of new materials that are as sustainable as possible, this also involves the use of existing materials and resources on site. Existing structures and materials can be recycled in a variety of ways, thus reducing the need for new resources. The existing hall structures are ideally suited for this purpose and can be used in a variety of ways.

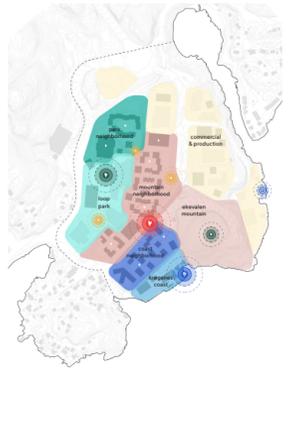

structure and plots. The structure of the future building plots is based on the existing hall structures and acts as a spatial backbone for Krøgenes. This allows for a flexible and sustainable development in several stages, in which the existing uses can be gradually transformed without being dependent on the natural handling of rainwater. In addition to the general subdivided into smaller areas. In addition to the plots, the public space is also strongly influenced by this structure. The Loop in particular, as the heart of Krøgenes, takes on a special role in this context. From this, a multitude of visual and spatial connections to the surrounding landscapes and neighborhoods are created.

resources

space. This cluster of resources represents the most important elements for spatial development in Krøgenes. A diverse mix of space offers creates a high-quality community that can be used by different user groups. Spatial inclusion is taken into account right from the start of planning. Through a step-by-step development, certain parameters can be adjusted and optimized. The cluster deals with typologies, organization and the management and development of the spaces.

neighborhoods and identity. The new structure makes it possible to create several different neighborhoods in Krøgenes. Due to the spatial context in connection with identifying forming places, neighborhoods with their own character can emerge and form their own address. This character should also be reflected in the typologies of the public spaces and their buildings. In this way, it is possible to unite different ways of life and needs in one spatial context. At the same time, the public space functions as a connecting element between the neighborhoods and makes the unique characteristics of each of them tangible for everyone. At special places such as plazas, parks or the coast, the specific identity becomes particularly visible.

green and blue infrastructure

green and blue infrastructure. The concept is based on a sustainable and forward-looking approach. The basic idea is to unseal as many areas as possible and at the same time to green them intensively. These green areas are to function as multiplexed areas that take on a supporting role in the natural handling of rainwater. In addition to the general green areas, this system also includes creating green roofs and green facades. At the same time, the green spaces in Krøgenes also function as attractive recreational areas and connections to the surrounding landscape. This creates optimal conditions for climate-adapted development for people and nature. The three most characteristic landscape elements are the Loop Park, the coast and the Skovlen mountain.

mobility system. The mobility system focuses on a walkable and bicycle-friendly approach. For this purpose, the traffic management and the parking situation for cars will be adjusted and optimized. A new roundabout allows access to the commercial area without having to drive through the natural handling of rainwater. In addition, three mobility hubs are being developed to cover the parking space requirements for cars and thus make it possible to design public space without parking slots. These mobility hubs are easy to reach on foot and allow easy transfer and connection to other uses. Delivery traffic and rescue services will of course remain accessible.

animal aided design

animal aided design. Sustainable planning with a holistic approach to people, the environment, as well as flora and fauna is a prerequisite for the development of new areas and neighborhoods. Therefore, the focus is also on the topic of circulatory metabolism. This includes responsible deal with topics such as the microclimate, water management, energy, food production, securing open spaces and their qualification. In addition, these factors should also be integrated aesthetically into the planning.

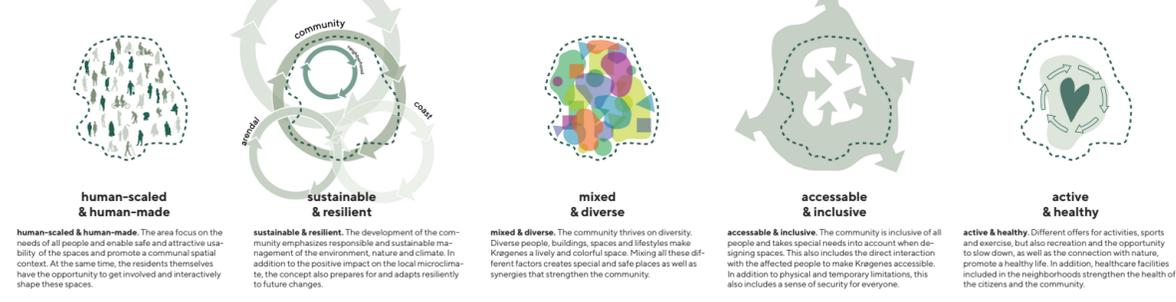

walking and human centered design. The way of living, working and its demands on getting around are changing and mobility has to be redefined. Away from a car-oriented planning to multi-modal and sustainable mobility with multiple flexible alternatives, which allows every person an inclusive and barrier-free access. At the same time, the relationship between traffic space and public space must be rethought and connected. The planning is carried out coverage and demand-oriented for every type of neighborhood and its environment.

sharing systems and bicycle infrastructure

sharing systems and bicycle infrastructure. A sustainable approach to the transformation of the area is indispensable in today's world. In addition to the climatic enhancements through the newly created green-blue structures and an optimized mobility system, another important issue is the use of materials. In addition to the use of new materials that are as sustainable as possible, this also involves the use of existing materials and resources on site. Existing structures and materials can be recycled in a variety of ways, thus reducing the need for new resources. The existing hall structures are ideally suited for this purpose and can be used in a variety of ways.

the caring community is...

- re-use:** re-use of existing materials and structures from on site for buildings and public spaces
- space to grow:** for long-term developments that can adapt within the process
- shared & common spaces:** for an optimal utilization of space due to more users
- flexible spaces:** flexible spaces that allow different uses
- active ground floors:** visible and active use of the ground floors in connection to the public space
- layering:** layering of different uses and functions within one building
- activity areas:** activity areas like sports, playgrounds, leisure, etc.
- co-spaces:** collectively used areas with different possibilities
- diverse typologies:** diverse typologies of buildings, units, public spaces and uses
- temporary spaces:** temporary spaces to test new developments and use space before other developments
- meeting points:** places in different scales and sizes to meet other people
- culture:** cultural offers like art, music, library, etc.
- flexible grid:** structures with possibilities of different arrangements within the grid
- active architecture:** possibility to actively use buildings and architecture
- recreational areas:** different recreational areas for humans and nature
- visibility:** visibility of uses and other users
- barrier-free:** barrier-free spaces that allow access to everyone
- mixed development:** developments for all budgets and incomes mix together
- hybrid space:** spaces mixing inside and outside
- community network:** networks to stay in touch, organize and care
- animal aided design:** approach to include animal needs within the planning
- (natural) rain retention:** rainwater management, infiltration, reusing, use
- walkability:** focus on pedestrian traffic
- sharing systems:** for an optimal utilization of mobility options due to more users
- active ground floors:** visible and active use of the ground floors in connection to the public space
- layering:** layering of different uses and functions within one building
- activity areas:** activity areas like sports, playgrounds, leisure, etc.
- co-spaces:** collectively used areas with different possibilities
- diverse typologies:** diverse typologies of buildings, units, public spaces and uses
- temporary spaces:** temporary spaces to test new developments and use space before other developments
- meeting points:** places in different scales and sizes to meet other people
- culture:** cultural offers like art, music, library, etc.
- flexible grid:** structures with possibilities of different arrangements within the grid
- active architecture:** possibility to actively use buildings and architecture
- recreational areas:** different recreational areas for humans and nature
- visibility:** visibility of uses and other users
- barrier-free:** barrier-free spaces that allow access to everyone
- mixed development:** developments for all budgets and incomes mix together
- hybrid space:** spaces mixing inside and outside
- community network:** networks to stay in touch, organize and care
- animal aided design:** approach to include animal needs within the planning
- (natural) rain retention:** rainwater management, infiltration, reusing, use
- walkability:** focus on pedestrian traffic
- sharing systems:** for an optimal utilization of mobility options due to more users
- active ground floors:** visible and active use of the ground floors in connection to the public space
- layering:** layering of different uses and functions within one building
- activity areas:** activity areas like sports, playgrounds, leisure, etc.
- co-spaces:** collectively used areas with different possibilities
- diverse typologies:** diverse typologies of buildings, units, public spaces and uses
- temporary spaces:** temporary spaces to test new developments and use space before other developments
- meeting points:** places in different scales and sizes to meet other people
- culture:** cultural offers like art, music, library, etc.
- flexible grid:** structures with possibilities of different arrangements within the grid
- active architecture:** possibility to actively use buildings and architecture
- recreational areas:** different recreational areas for humans and nature
- visibility:** visibility of uses and other users
- barrier-free:** barrier-free spaces that allow access to everyone
- mixed development:** developments for all budgets and incomes mix together
- hybrid space:** spaces mixing inside and outside
- community network:** networks to stay in touch, organize and care
- animal aided design:** approach to include animal needs within the planning
- (natural) rain retention:** rainwater management, infiltration, reusing, use
- walkability:** focus on pedestrian traffic
- sharing systems:** for an optimal utilization of mobility options due to more users
- active ground floors:** visible and active use of the ground floors in connection to the public space
- layering:** layering of different uses and functions within one building
- activity areas:** activity areas like sports, playgrounds, leisure, etc.
- co-spaces:** collectively used areas with different possibilities
- diverse typologies:** diverse typologies of buildings, units, public spaces and uses
- temporary spaces:** temporary spaces to test new developments and use space before other developments
- meeting points:** places in different scales and sizes to meet other people
- culture:** cultural offers like art, music, library, etc.
- flexible grid:** structures with possibilities of different arrangements within the grid
- active architecture:** possibility to actively use buildings and architecture
- recreational areas:** different recreational areas for humans and nature
- visibility:** visibility of uses and other users
- barrier-free:** barrier-free spaces that allow access to everyone
- mixed development:** developments for all budgets and incomes mix together
- hybrid space:** spaces mixing inside and outside
- community network:** networks to stay in touch, organize and care
- animal aided design:** approach to include animal needs within the planning
- (natural) rain retention:** rainwater management, infiltration, reusing, use
- walkability:** focus on pedestrian traffic
- sharing systems:** for an optimal utilization of mobility options due to more users
- active ground floors:** visible and active use of the ground floors in connection to the public space
- layering:** layering of different uses and functions within one building
- activity areas:** activity areas like sports, playgrounds, leisure, etc.
- co-spaces:** collectively used areas with different possibilities
- diverse typologies:** diverse typologies of buildings, units, public spaces and uses
- temporary spaces:** temporary spaces to test new developments and use space before other developments
- meeting points:** places in different scales and sizes to meet other people
- culture:** cultural offers like art, music, library, etc.
- flexible grid:** structures with possibilities of different arrangements within the grid
- active architecture:** possibility to actively use buildings and architecture
- recreational areas:** different recreational areas for humans and nature
- visibility:** visibility of uses and other users
- barrier-free:** barrier-free spaces that allow access to everyone
- mixed development:** developments for all budgets and incomes mix together
- hybrid space:** spaces mixing inside and outside
- community network:** networks to stay in touch, organize and care
- animal aided design:** approach to include animal needs within the planning
